SUMMARY

Backend & AI engineer with a Computer Science degree and around a year of professional experience, focused on Python backend services and production-grade LLM applications. I build resilient FastAPI and Django/DRF services and multi-provider LLM systems with automatic failover, API-key rotation, and RAG. Early in my career and still growing, but steady about shipping, writing tests, and seeing work through.

SKILLS

- **LLM application engineering** — multi-provider integration with automatic failover and API-key rotation, RAG, prompt design, and token budgeting to fit large inputs into model context windows.
- **Resilient backend services** — asynchronous APIs, background-job crash recovery (lease/watchdog patterns), retries, and graceful degradation under rate limits.
- **Web data extraction** — SSRF-safe fetching, anti-bot challenge handling, and scope-controlled crawling with per-field quality scoring.
- **Secure by default** — encrypted credential storage (Fernet), JWT authentication, and secret redaction in logs.
- **Core** — Python, FastAPI, Django/DRF, PostgreSQL, Redis, Docker, SQLAlchemy/Alembic, LiteLLM, React/TypeScript, Git, Linux.

EXPERIENCE

Dekamond — Software Developer

2025 · 6 months

Valiasr Square, Tehran · Hybrid

- Built AI and automation features for Kaleri.ai across business-intelligence tooling, RAG systems, and internal developer tools.
- Developed multi-provider LLM workflows (LangGraph + RAG) behind FastAPI services, integrating OpenRouter and Google AI.
- Cut LLM running costs by ~70% through model routing, caching, and prompt optimization.

Arnikip — Django Developer (Backend)

2024 · 6 months

Remote · includes 2-month internship

- Built and maintained REST APIs for a food-delivery platform as part of a 5-person team (2 backend, 3 frontend).
- Modeled catalog and order data (DRF + PostgreSQL); offloaded order processing and notifications to Celery with Redis as broker/cache; containerized services with Docker.
- Collaborated via GitLab and Trello; tested with pytest and Postman.

PROJECTS

ScrapeGPT — self-hosted, AI-assisted web data-extraction app

FastAPI · SQLAlchemy · React/TS · LiteLLM

- Turns any URL into structured data through a guided analyze → review → extract flow: an LLM proposes the fields and CSS selectors, then the app self-heals them against the real HTML so an imperfect guess still yields data.
- Production-hardened: SSRF-safe fetching, evidence-based crawl scope, crash-tolerant crawling (leased queue + watchdog), and Fernet-encrypted bring-your-own-key credentials.

github.com/Sina-Amare/ScrapeGpt

Aigram — self-hosted, installable AI messenger (formerly SakaiBot)

Python · Telethon · FastAPI · PWA

- Turns your own Telegram account into an installable AI messenger — a Telethon/MTPROTO userbot behind a FastAPI + PWA — with an in-chat LLM co-pilot: summarize, ask, translate, image generation, and voice (STT/TTS).
- Resilient by design: Gemini → OpenRouter failover with multi-key rotation, and a single audited send-path with ban-safety (FloodWait) throttling.

github.com/Sina-Amare/Aigram

RubricEval — rubric-driven code-evaluation platform

Next.js · FastAPI · SQLAlchemy · LiteLLM

- Scores a GitHub repo or ZIP against a versioned, weighted rubric: an LLM grades each criterion while a deterministic policy function makes the final accept / review / reject call — reproducible and auditable.
- Every citation is verified against the real files; a durable leased job queue, SSE streaming, and a FakeLLM port make it crash-tolerant and testable offline (clean ports-and-adapters).

EDUCATION

M.Sc., Software Engineering — Islamic Azad University

2025 – present

Science & Research Branch, Tehran

B.Sc., Computer Science — University of Guilan

2020 – 2024

Rasht · Undergraduate research on Particle Swarm Optimization

AWARDS & LANGUAGES

- 2nd place, team Python programming competition, University of Guilan (2023).
- Languages: English (professional working proficiency) · Persian (native).
